

Building Information Modeling (BIM) and Measuring Techniques

Christian CLEMEN, Robert EHRICH and Christopher VAN ZYL, Germany

Project: As-built survey for BIM

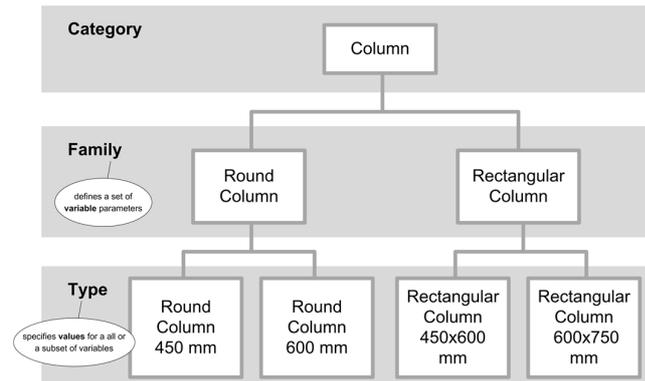

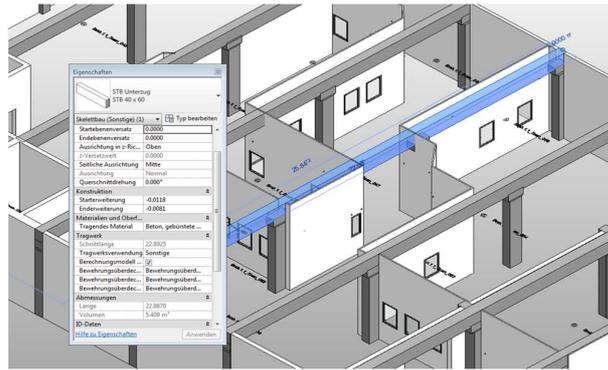

Copyright for images (BMB GmbH and HTW-Dresden)

Semantic Modeling (product model)

Working Method:

- identification and specification of new types (e.g. doors, windows)
- data acquisition includes semantics (columns, beam)
- with BIM, CAD-"drawing" becomes real modeling.

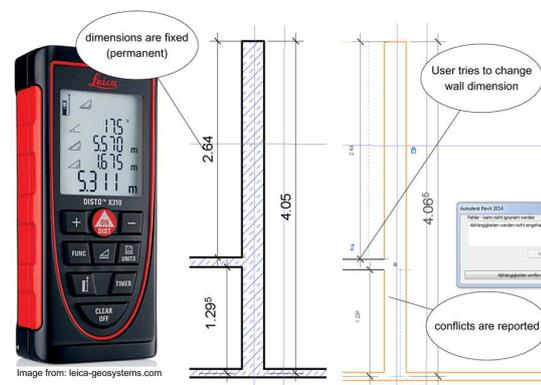

Parametric Object Modeling

- **Rule based** control (e.g. windows must not overlap each other)
- Semantic object definition is strictly **linked to geometry** with the set of parameters.

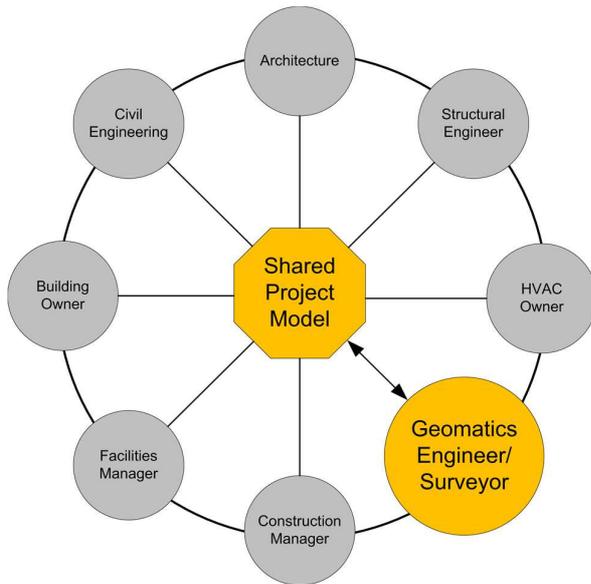

Working Method:

1. Specification of **object type**
2. Enter **measured dimensions** and specify topological relations (graphically)
3. **Conflicts** are reported immediately. Model is always consistent.

Drawback: Geometric variations are not easy to model. Better use CAD for historic buildings.

Technical Project Management

Goal

- consistent model
- automatically updated views

Way of working

- *check-in* surveying results
- *check-out* for stake-out and model update (changes)

Prerequisites

- nonredundant object modelling
- associated data and rules

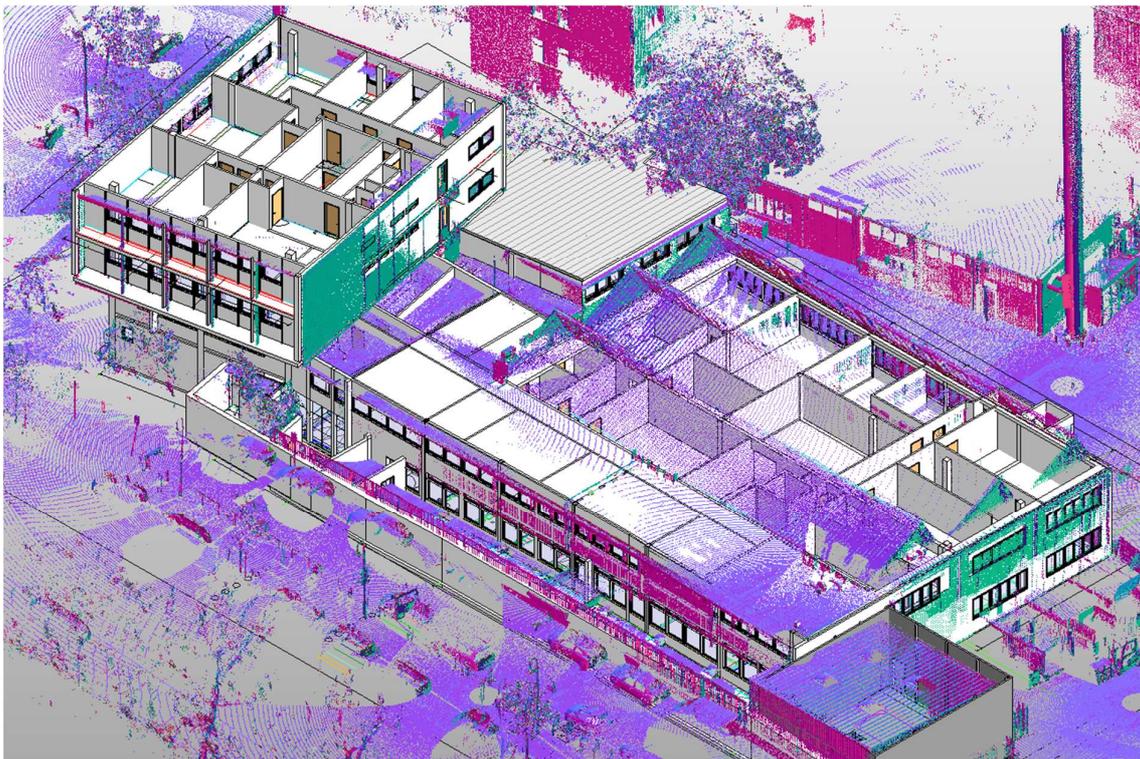

BIM and Measuring Techniques

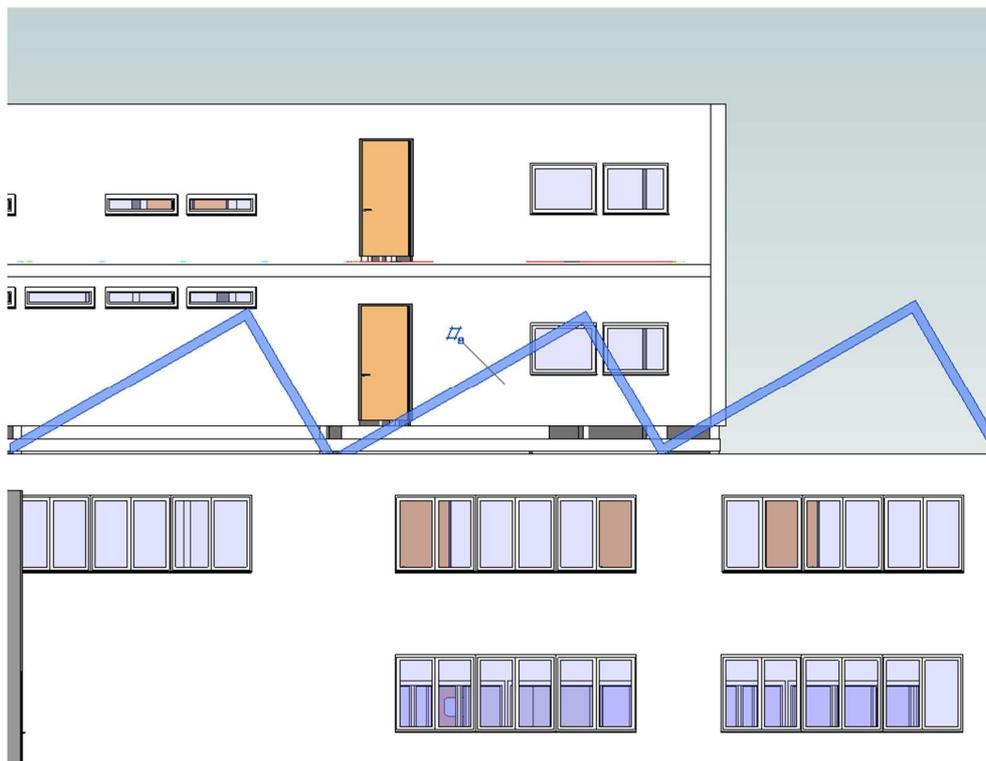

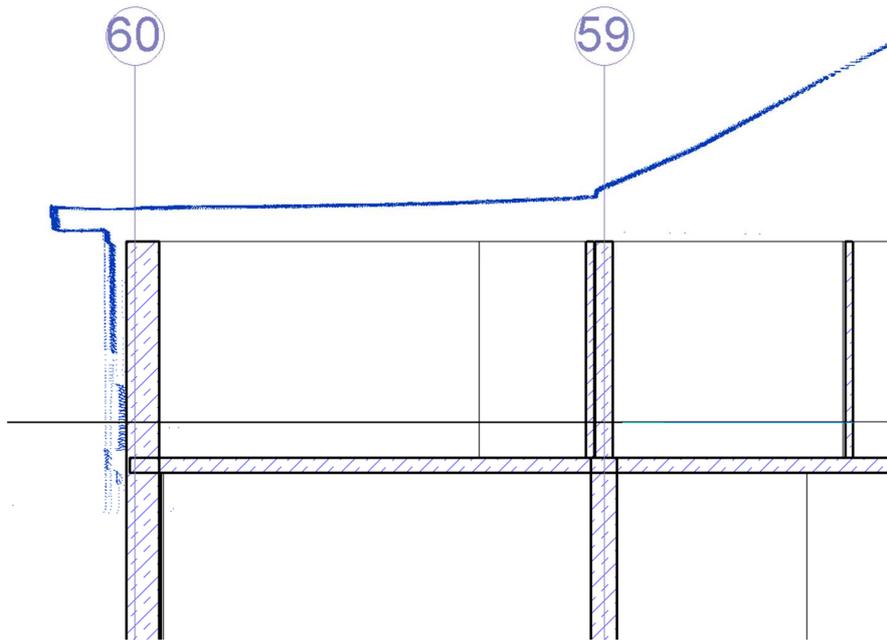

1. Tacheometry
2. Laser scanning (point cloud)
3. Laser scanning (registered scan view)

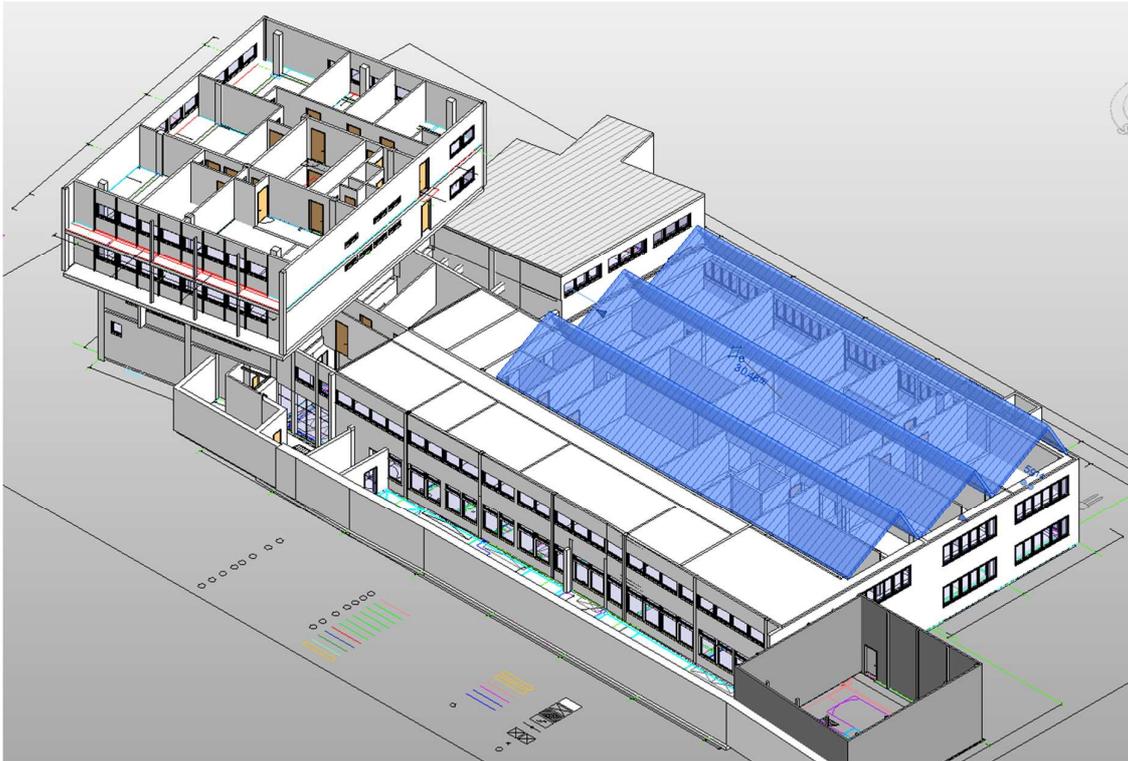

1. **Polar Survey** with point codes
 - Consistent spatial reference
 - Code (Window, Wall, Fence,...)
2. **Constraints and Fitting**
 - planar (points in plane)
 - rectangular (wall-ceiling, wall-wall)
3. **Derivation** of building element **parameters**
 - Directly measured or
 - COGO / CAD pick off
4. **CAD to BIM**
 - Semantics from layer
 - Object geometry from points and lines

- **! BIM-site model** imports point coordinates directly and generates DTM.

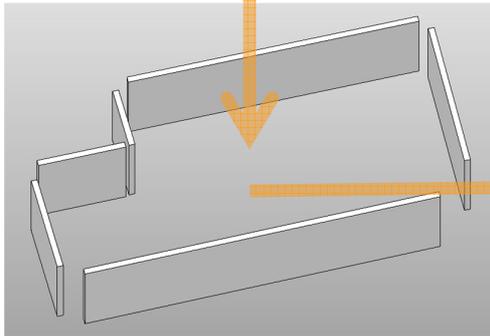

BIM and Measuring Techniques

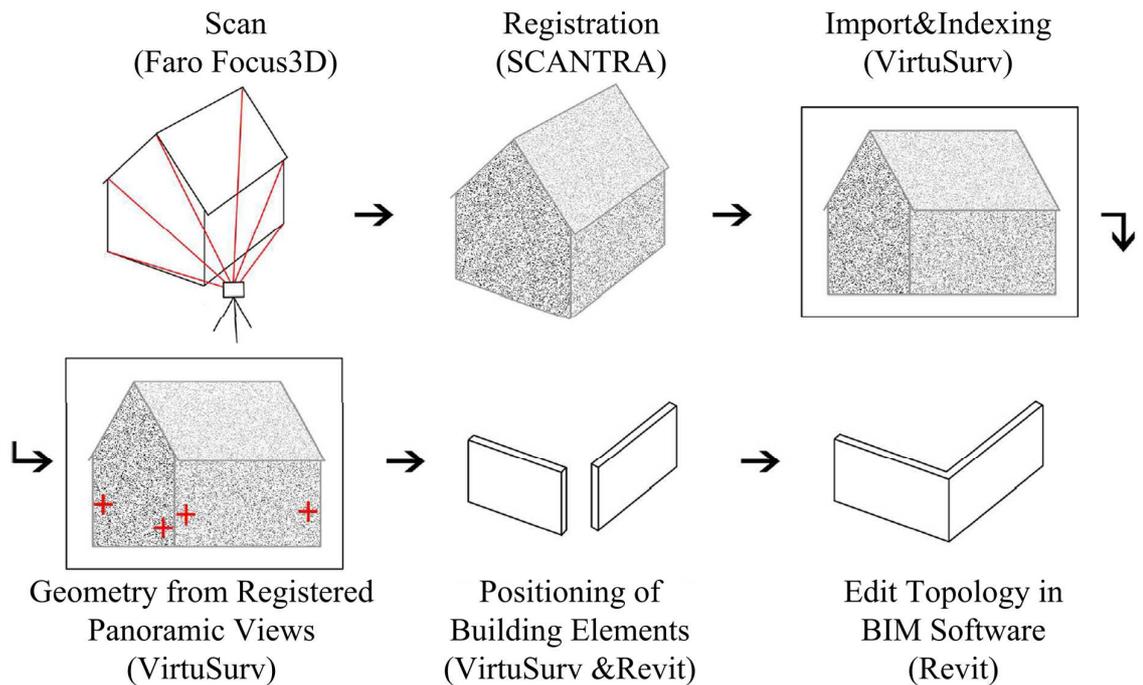

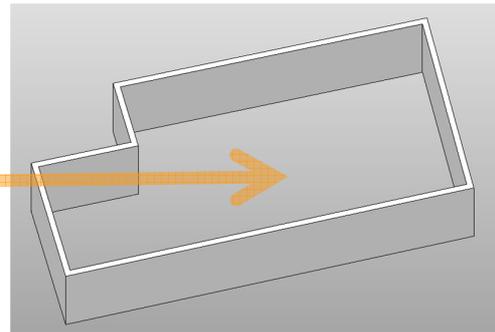

1. Tacheometry
2. Laser scanning (point cloud)
- 3. Laser scanning (registered scan view)**

Specialized Data

Conclusion

- BIM will not replace CAD. But BIM is getting very important, also for as-built surveys.
- Real BIM:
 - object oriented product model
 - parametric modeling
 - shared product model
- Conventional CAD-surveying techniques are to be adapted to the BIM-method.
